

Learning Layer Framework

What is a Learning Layer?

A Learning Layer is an intentional structure embedded within programs to capture data, feedback, observations, and sensemaking - allowing for adaptation without waiting for endline evaluations.

Why It Matters

Traditional MEL systems often capture results but miss the how and why of change. Learning Layers create space for structured reflection, adaptive course correction, and institutional memory.

Core Components

- Embedded reflection practices (pause-and-reflect)
- Adaptive indicator dashboards
- Field diaries and qualitative signals
- Internal peer learning and storytelling
- Integration with decision-making structures

How to Use This Framework

Use this framework to design MEL or KM systems that don't just evaluate, but evolve. It's especially valuable in complex, rapidly shifting contexts like public health emergencies, education reforms, or climate response.
